

COMPLAINT

1-2 bind-up, costly replacement of cases

CAUSE

A dragging band due to a deformed bore and loosened pin.

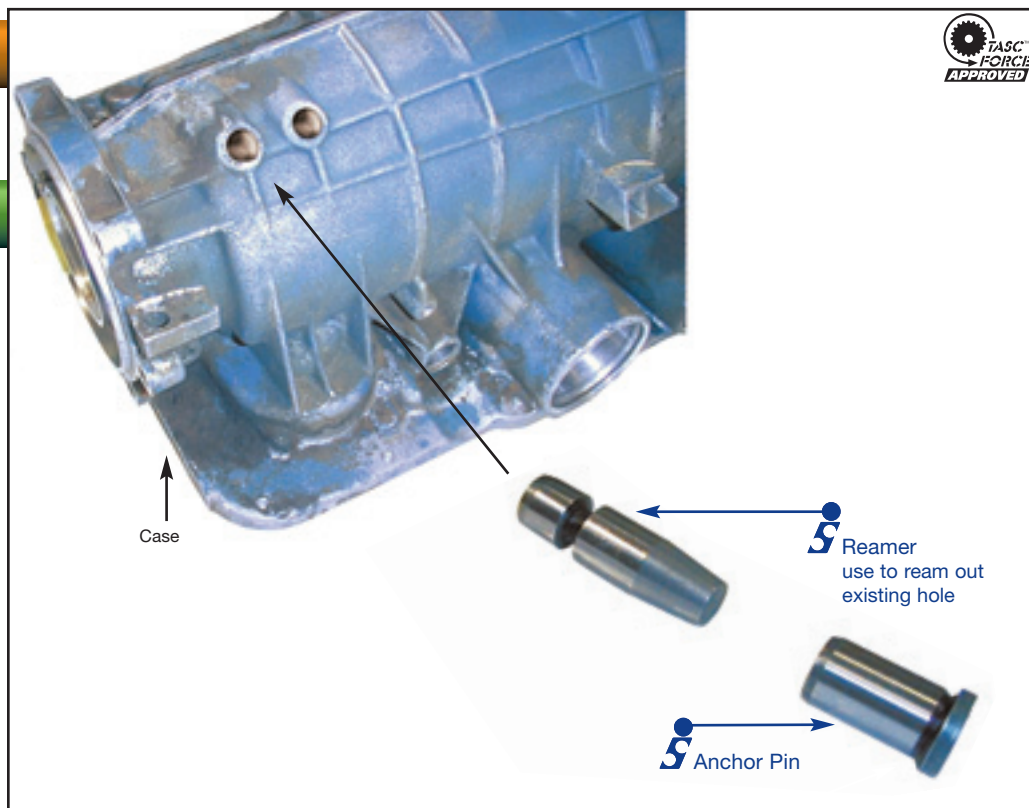

CORRECTION

This rear band anchor pin kit is a simple solution that ensures correct pin depth set-up and salvages A4LD cases with early uncapped rear band anchors.

Rear Band Anchor Pin Kit

56521-K

10 Oversized Pins
1 Reamer

Sonnax Part Summary

A4LD rear band anchor pins are hammered sideways in their bore by every apply of the band. This constant hammering deforms the bore and loosens the pin. Once loose, the pin is able to move in or out of the case, resulting in erratic band performance. Since it is the bore that is worn, a new pin cannot be used, since it will exhibit the same problem. In the past, the only option has been to scrap every case with a worn bore. Sonnax kit **56521-K** allows the case to be salvaged.

Features & Benefits

- Kit contains 10 oversized pins and a specially designed reamer that resizes and requalifies the hole, preparing it for the use of the oversized pins.
