Installation Instructions

Total input clutch housing endplay should be from .005" to .020", including gasket crush.

There are two procedures that accomplish similar results:

1. A method used by most shops is to use a feeler-gauge to obtain a measurement from the driven sprocket support (channel plate mating surface) to the case-gasket surface (case gasket removed, and differential preloaded toward input drum). The driven sprocket support should be flush to .017" recessed when measured with a straightedge placed on the case surface. If the measurement exceeds .020", a shim or shims should be added, either Sonnax 84733-10 (.010") or **84744-20** (.020"). The Sonnax recommended shim position is between the drum and the OEM shim.

Note: The gasket when torqued will result in additional endplay of .005" to .008". The compressed gasket thickness must be added to the straightedge and the feeler-gauge measurement.

2. OEM has a tool available from Kent Moore (# J-33386), which results in using the OEM selective shim to verify unit endplay. (See unit repair manual for this procedure.) Their procedure will result in a .005" to .012" input drum clearance.
